Chapter 1

Technical Solution

1.1 File Tree Diagram

To help navigate through the source code, I have included the following directory tree diagram, and put appropiate comments to explain the general purpose of code contained within specifc directories and Python files.

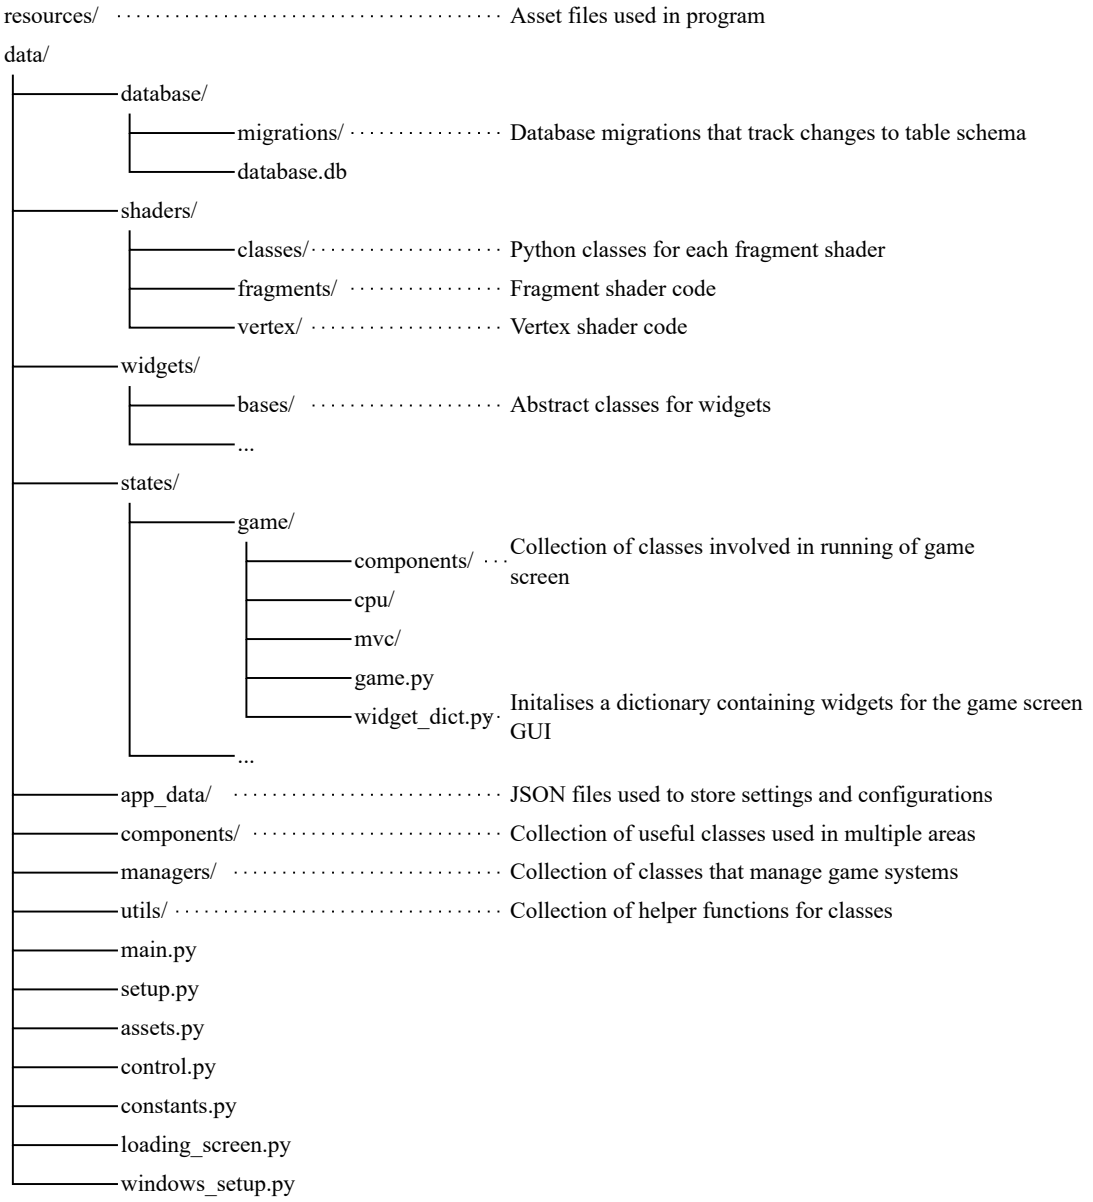

Figure 1.1: File tree diagram

1.2 Summary of Complexity

- Alpha-beta pruning and transposition table improvements for Minimax (1.6.2 and 1.6.3)
- Shadow mapping and coordinate transformations
- Recursive Depth-First Search tree traversal (1.3.4 and 1.6.1)
- Circular doubly-linked list and stack (1.4.3)
- Multipass shaders and gaussian blur
- Aggregate and Window SQL functions
- OOP techniques (1.4.3 and 1.4.4)
- Multithreading (1.3.2 and 1.6.5)
- Bitboards (1.5.5)
- Zobrist hashing (1.6.6)
- (File handling and JSON parsing) (1.3.3)
- (Dictionary recursion) (1.3.4)
- (Dot product) (1.3.3)

1.3 Overview

1.3.1 Main

The file `main.py` is run by the root file `run.py`. Here resources-intensive classes such as the state and asset files are initialised, while the program displays a loading screen to hide the loading process. The main game loop is then executed.

`main.py`

```
from sys import platform
# Initialises Pygame
import data.setup

# Windows OS requires some configuration for Pygame to scale GUI continuously
    while window is being resized
if platform == 'win32':
    import data.windows_setup as win_setup

from data.loading_screen import LoadingScreen

states = [None, None]

def load_states():
    """
    Initialises instances of all screens, executed on another thread with results
    being stored to the main thread by modifying a mutable such as the states list
    """
    from data.control import Control
    from data.states.game.game import Game
    from data.states.menu.menu import Menu
```

```
    from data.states.settings.settings import Settings
    from data.states.config.config import Config
    from data.states.browser.browser import Browser
    from data.states.review.review import Review
    from data.states.editor.editor import Editor

    state_dict = {
        'menu': Menu(),
        'game': Game(),
        'settings': Settings(),
        'config': Config(),
        'browser': Browser(),
        'review': Review(),
        'editor': Editor()
    }

    app = Control()

    states[0] = app
    states[1] = state_dict

loading_screen = LoadingScreen(load_states)

def main():
    """
    Executed by run.py, starts main game loop
    """
    app, state_dict = states

    if platform == 'win32':
        win_setup.set_win_resize_func(app.update_window)

    app.setup_states(state_dict, 'menu')
    app.main_game_loop()
```

1.3.2 Loading Screen

Multithreading is used to separate the loading screen GUI from the resources intensive actions in `main.py`, to keep the GUI responsive. The easing function `easeOutBack` is also used to animate the logo.

loading_screen.py

```
import pygame
import threading
import sys
from pathlib import Path
from data.utils.load_helpers import load_gfx, load_sfx
from data.managers.window import window
from data.managers.audio import audio

FPS = 30
start_ticks = pygame.time.get_ticks()
logo_gfx_path = (Path(__file__).parent / '../resources/graphics/gui/icons/logo/
    logo.png').resolve()
sfx_path_1 = (Path(__file__).parent / '../resources/sfx/loading_screen/
    loading_screen_1.wav').resolve()
sfx_path_2 = (Path(__file__).parent / '../resources/sfx/loading_screen/
    loading_screen_2.wav').resolve()

def easeOutBack(progress):
```

```
    """
    Represents a cubic function for easing the logo position.
    Starts quickly and has small overshoot, then ends slowly.

    Args:
        progress (float): x-value for cubic function ranging from 0-1.

    Returns:
        float: 2.70x^3 + 1.70x^2 + 0x + 1, where x is time elapsed.
    """
    c2 = 1.70158
    c3 = 2.70158

    return c3 * ((progress - 1) ** 3) + c2 * ((progress - 1) ** 2) + 1

class LoadingScreen:
    def __init__(self, target_func):
        """
        Creates new thread, and sets the load_state() function as its target.
        Then starts draw loop for the loading screen.

        Args:
            target_func (Callable): function to be run on thread.
        """
        self._clock = pygame.time.Clock()
        self._thread = threading.Thread(target=target_func)
        self._thread.start()

        self._logo_surface = load_gfx(logo_gfx_path)
        self._logo_surface = pygame.transform.scale(self._logo_surface, (96, 96))
        audio.play_sfx(load_sfx(sfx_path_1))
        audio.play_sfx(load_sfx(sfx_path_2))

        self.run()

    @property
    def logo_position(self):
        duration = 1000
        displacement = 50
        elapsed_ticks = pygame.time.get_ticks() - start_ticks
        progress = min(1, elapsed_ticks / duration)
        center_pos = ((window.screen.size[0] - self._logo_surface.size[0]) / 2, (
    window.screen.size[1] - self._logo_surface.size[1]) / 2)

        return (center_pos[0], center_pos[1] + displacement - displacement *
    easeOutBack(progress))

    @property
    def logo_opacity(self):
        return min(255, (pygame.time.get_ticks() - start_ticks) / 5)

    @property
    def duration_not_over(self):
        return (pygame.time.get_ticks() - start_ticks) < 1500

    def event_loop(self):
        """
        Handles events for the loading screen, no user input is taken except to
    quit the game.
        """
        for event in pygame.event.get():
            if event.type == pygame.QUIT:
```

```
                pygame.quit()
                sys.exit()

    def draw(self):
        """
        Draws logo to screen.
        """
        window.screen.fill((0, 0, 0))

        self._logo_surface.set_alpha(self.logo_opacity)
        window.screen.blit(self._logo_surface, self.logo_position)

        window.update()

    def run(self):
        """
        Runs while the thread is still setting up our screens, or the minimum loading screen duration is not reached yet.
        """
        while self._thread.is_alive() or self.duration_not_over:
            self.event_loop()
            self.draw()
            self._clock.tick(FPS)
```

1.3.3 Helper functions

These files provide useful functions for different classes.

`asset_helpers.py (Functions used for assets and pygame Surfaces)`

```
import pygame
from PIL import Image
from functools import cache
from random import sample, randint
import math

@cache
def scale_and_cache(image, target_size):
    """
    Caches image when resized repeatedly.

    Args:
        image (pygame.Surface): Image surface to be resized.
        target_size (tuple[float, float]): New image size.

    Returns:
        pygame.Surface: Resized image surface.
    """
    return pygame.transform.scale(image, target_size)

@cache
def smoothscale_and_cache(image, target_size):
    """
    Same as scale_and_cache, but with the Pygame smoothscale function.

    Args:
        image (pygame.Surface): Image surface to be resized.
        target_size (tuple[float, float]): New image size.

    Returns:
        pygame.Surface: Resized image surface.
    """
```

```
33      return pygame.transform.smoothscale(image, target_size)
34
35  def gif_to_frames(path):
36      """
37      Uses the PIL library to break down GIFs into individual frames.
38
39      Args:
40          path (str): Directory path to GIF file.
41
42      Yields:
43          PIL.Image: Single frame.

1.4.3 Widget Bases

Widget bases are the base classes for for my widgets system. They contain both attributes and getter methods that provide basic functionality such as size and position, and abstract methods to be overriden. These bases are also designed to be used with multiple inheritance, where multiple bases can be combined to add functionality to the final widget. Encapsulation also allows me to simplify interactions between widgets, as using getter methods instead of protected attributes allows me to add logic while accessing an attribute, such as in `widget.py`, where the logic to fetch the parent surface instead of the windows screen is hidden within the base class.

All widgets are a subclass of the `Widget` class.
`widget.py`

```
1  import pygame
2  from data.constants import SCREEN_SIZE
3  from data.managers.theme import theme
4  from data.assets import DEFAULT_FONT
5
6  DEFAULT_SURFACE_SIZE = SCREEN_SIZE
7  REQUIRED_KWARGS = ['relative_position', 'relative_size']
8
9  class _Widget(pygame.sprite.Sprite):
10     def __init__(self, **kwargs):
11         """
```

```
12          Every widget has the following attributes:
13
14          surface (pygame.Surface): The surface the widget is drawn on.
15          raw_surface_size (tuple[int, int]): The initial size of the window screen,
     remains constant.
16          parent (_Widget, optional): The parent widget position and size is
    relative to.
17
18          Relative to current surface:
19          relative_position (tuple[float, float]): The position of the widget
    relative to its surface.
20          relative_size (tuple[float, float]): The scale of the widget relative to
    its surface.
21
22          Remains constant, relative to initial screen size:
23          relative_font_size (float, optional): The relative font size of the widget
    .
24          relative_margin (float): The relative margin of the widget.
25          relative_border_width (float): The relative border width of the widget.
26          relative_border_radius (float): The relative border radius of the widget.
27
28          anchor_x (str): The horizontal anchor direction ('left', 'right', 'center
    ').
29          anchor_y (str): The vertical anchor direction ('top', 'bottom', 'center').
30          fixed_position (tuple[int, int], optional): The fixed position of the
    widget in pixels.
31          border_colour (pygame.Color): The border color of the widget.
32          text_colour (pygame.Color): The text color of the widget.
33          fill_colour (pygame.Color): The fill color of the widget.
34          font (pygame.freetype.Font): The font used for the widget.
35          """

1.4.4 Widgets

Each state contains a `WIDGET_DICT` map, which contains and initialises each widget with their own attributes, and provides references to run methods on them in the state code. Each `WIDGET_DICT` is passed into a `WidgetGroup` object, which is responsible for drawing, resizing and handling all widgets for the current state.

The `CustomEvent` class is used to pass data between states and widgets. An event argument is passed into interactive widgets; When a widget wants to pass data back to the state, it returns the event, and adds any attributes that is required. The state then receives and handles these returned events accordingly.

custom_event.py

```
1  from data.constants import GameEventType, SettingsEventType, ConfigEventType,
       BrowserEventType, EditorEventType
2
3  required_args = {
4      GameEventType.BOARD_CLICK: ['coords'],

61
62          else:
63              return event_cls(event_type)
```

Below is a list of all the widgets I have implemented:

- BoardThumbnailButton
- MultipleIconButton
- ReactiveIconButton
- BoardThumbnail
- ReactiveButton
- VolumeSlider
- ColourPicker
- ColourButton
- BrowserStrip
- PieceDisplay
- BrowserItem
- TextButton
- IconButton
- ScrollArea
- Chessboard
- TextInput
- Rectangle
- MoveList
- Dropdown
- Carousel
- Switch
- Timer
- Text
- Icon
- (_ColourDisplay)
- (_ColourSquare)
- (_ColourSlider)
- (_SliderThumb)
- (_Scrollbar)

The `ReactiveIconButton` widget is a pressable button that changes the icon displayed when it is hovered or pressed.

`reactive_icon_button.py`

```
1 from data.widgets.reactive_button import ReactiveButton
2 from data.constants import WidgetState
3 from data.widgets.icon import Icon
4
5 class ReactiveIconButton(ReactiveButton):
6     def __init__(self, base_icon, hover_icon, press_icon, **kwargs):
```

```
        # Composition is used here, to initialise the Icon widgets for each widget state
        widgets_dict = {
            WidgetState.BASE: Icon(
                parent=kwargs.get('parent'),
                relative_size=kwargs.get('relative_size'),
                relative_position=(0, 0),
                icon=base_icon,
                fill_colour=(0, 0, 0, 0),
                border_width=0,
                margin=0,
                fit_icon=True,
            ),
            WidgetState.HOVER: Icon(
                parent=kwargs.get('parent'),
                relative_size=kwargs.get('relative_size'),
                relative_position=(0, 0),
                icon=hover_icon,
                fill_colour=(0, 0, 0, 0),
                border_width=0,
                margin=0,
                fit_icon=True,
            ),
            WidgetState.PRESS: Icon(
                parent=kwargs.get('parent'),
                relative_size=kwargs.get('relative_size'),
                relative_position=(0, 0),

1.6 CPU

This section includes my implementation for the CPU engine run on minimax, including its various improvements and accessory classes.

Every CPU engine class is a subclass of a `BaseCPU` abstract class, and therefore contains the same attribute and method names. This means polymorphism can be used again to easily to test and vary the difficulty by switching out which CPU engine is used.

The method `find_move` is called by the CPU thread. `search` is then called recursively to traverse the minimax tree, and find an optimal move. The move is then return to `find_move` and passed and run with the callback function.

1.6.1 Minimax

`minimax.py`

```
1  from data.states.game.cpu.base import BaseCPU
2  from data.constants import Score, Colour
3  from random import choice
4  
5  class MinimaxCPU(BaseCPU):
6      def __init__(self, max_depth, callback, verbose=False):

```

1.7 Database

This section outlines my database implementation using Python sqlite3.

1.7.1 DDL

As mentioned in Section ??, the `migrations` directory contains a collection of Python scripts that edit the game table schema. The files are named with their changes and datetime labelled for organisational purposes.

`create_games_table_19112024.py`

```
1  import sqlite3
2  from pathlib import Path
3
4  database_path = (Path(__file__).parent / '../database.db').resolve()
5
6  def upgrade():
7      """
8      Upgrade function to create games table.
9      """
10     connection = sqlite3.connect(database_path)
11     cursor = connection.cursor()
12
13     cursor.execute('''
14         CREATE TABLE games(
15             id INTEGER PRIMARY KEY,
16             cpu_enabled INTEGER NOT NULL,
17             cpu_depth INTEGER,
18             winner INTEGER,
19             time_enabled INTEGER NOT NULL,
20             time REAL,
21             number_of_ply INTEGER NOT NULL,
22             moves TEXT NOT NULL
23         )
24     ''')
25
26     connection.commit()
27     connection.close()
28
29 def downgrade():
30     """
31     Downgrade function to revert table creation.
32     """
33     connection = sqlite3.connect(database_path)
34     cursor = connection.cursor()
35
36     cursor.execute('''
37         DROP TABLE games
38     ''')
39
40     connection.commit()
41     connection.close()
42
43 upgrade()
44 # downgrade()
```

Using the ALTER command allows me to rename table columns.

change_fen_string_column_name_23122024.py

```
import sqlite3
from pathlib import Path

database_path = (Path(__file__).parent / '../database.db').resolve()

def upgrade():
    """
    Upgrade function to rename fen_string column.
    """
    connection = sqlite3.connect(database_path)
    cursor = connection.cursor()

    cursor.execute('''
        ALTER TABLE games RENAME COLUMN fen_string TO final_fen_string
    ''')

    connection.commit()
    connection.close()

def downgrade():
    """
    Downgrade function to revert fen_string column renaming.
    """
    connection = sqlite3.connect(database_path)
    cursor = connection.cursor()

    cursor.execute('''
        ALTER TABLE games RENAME COLUMN final_fen_string TO fen_string
    ''')

    connection.commit()
    connection.close()

upgrade()
# downgrade()
```
